Graz, March, 2010

HS-ART presents "DIAMANT DustBuster+" at NAB2010 (SL9706)

DustBuster+ is an extension to the DIAMANT digital film restoration software. The Repair-Filter allows a fully automatic cleaning work-flow, supported by an integrated interactive quality control environment. DustBuster+ has been designed for any type of restoration project and workflow.

DustBuster+ results from a consequent further development of the DIAMANT DustBuster. Thus it contains all integrated and interactive features of DustBuster (AutoFix & Retouching tools), but also new tools such as the repair filter (REPAIR) and a basic color correction (COLOR) to be used on a timeline.

The REPAIR filter provides high quality automatic cleaning using fast and reliable GPU based optical flow motion analysis. This reduces human operator intervention to the minimum level, beyond the current state of the art.

All processing is recorded on a meta-data level, so any changes can be easily re-applied to the sequence any time and the final images are created only when they are really needed. One beneficial consequence is the parallelization of grading and restoration.

DIAMANT DustBuster+ has been developed to work in a professional environment, is available on Windows and runs on nearly any modern standard PC hardware. A Mac OS-X based version will be released in summer 2010.

About HS-ART Digital Service GmbH: HS-ART is a technology company based in Graz, Austria. HS-ART provides software solutions in the fields of digital film restoration and media monitoring. The main product is the DIAMANT digital film restoration software which is one of the leading solutions in the market.
